

Migration of mobile cloud applications, graph processing, real-time event detection

Felix Cuadrado

- Control applications across clouds
 - adapt dynamically to user mobility
 - minimize latency, provide resiliency and independence
 - scalable information sharing
- Big data dynamic graph processing
 - parallel processing
 - support for dynamic graphs
 - performance optimization
- Real-time monitoring and event detection
 - mining social media streams
 - detect trends and events from real-world information
 - optimize computation to stream changes
