2019 Intelligent Sensing Summer School - 2-6 September

Robot self-calibration from touch events

Rodrigo Neves Zenha

Personal Background

- **Masters @ Instituto Superior Técnico**
Real-Time Distributed Control Systems
Lisbon, 2012-2018
- **MSc thesis @ VisLab Lisbon;**
Adaptation of a Robot Body Schema Based on Touch Events
Institute for Systems and Robotics, Lisbon, 2017-2018
- **PhD @ Queen Mary University of London**
Slip detection with a three-axis hall effect-based soft skin sensor.
London, March 2019 - Present

Motivation

- How do children learn to control precise body movements?

- How can robots learn to improve their accuracy?

Objectives

- Online calibration involving contacts;

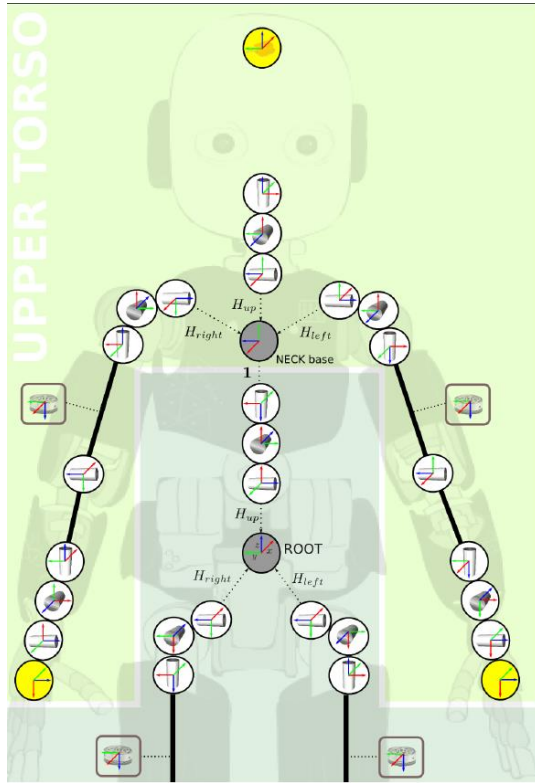

- Use tactile and proprioception sensors;

- Implementation on iCub robot simulator;

Problem Definition

iCub's upper torso DoFs.

- Our state (that we wish to estimate):

$$\boldsymbol{\beta}_t = [\beta_t^1 \beta_t^2 \dots \beta_t^N]^T \quad \text{Proprioception (joint encoders) bias}$$

- Our dynamic model:

$$\boldsymbol{\beta}_t = \boldsymbol{\beta}_{t-1} + \boldsymbol{\varepsilon}_t, \quad \boldsymbol{\varepsilon}_t \sim \mathcal{N}(0, \mathbf{Q})$$

- Our observation model:

$$z_k(\boldsymbol{\theta}_k^p + \hat{\boldsymbol{\beta}}_t) = \alpha_k + \delta_k, \quad \delta_t \sim \mathcal{N}(0, \mathbf{R})$$

Data Incorporation Strategies

- 3 data incorporation strategies:

Aggregation of Multiple Observations

Estimation Differential Entropy Evaluation

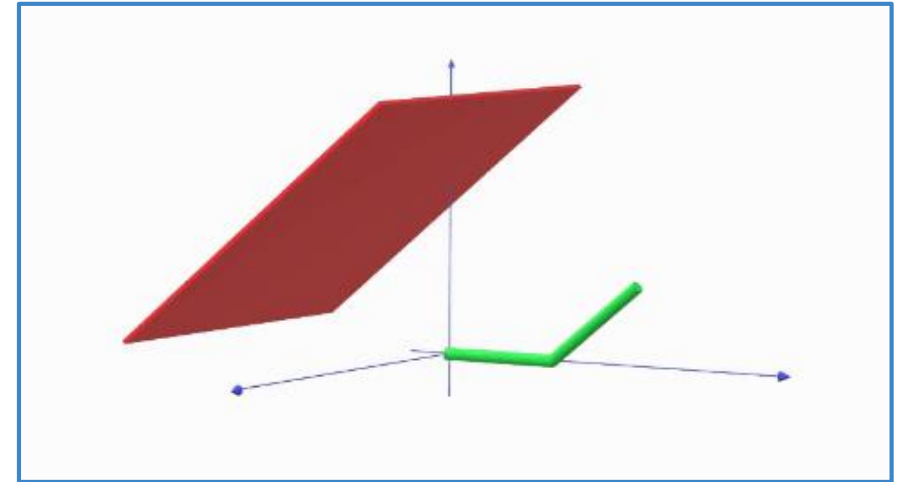

Anti-Windup Control

Experiments

Experimental Environment.

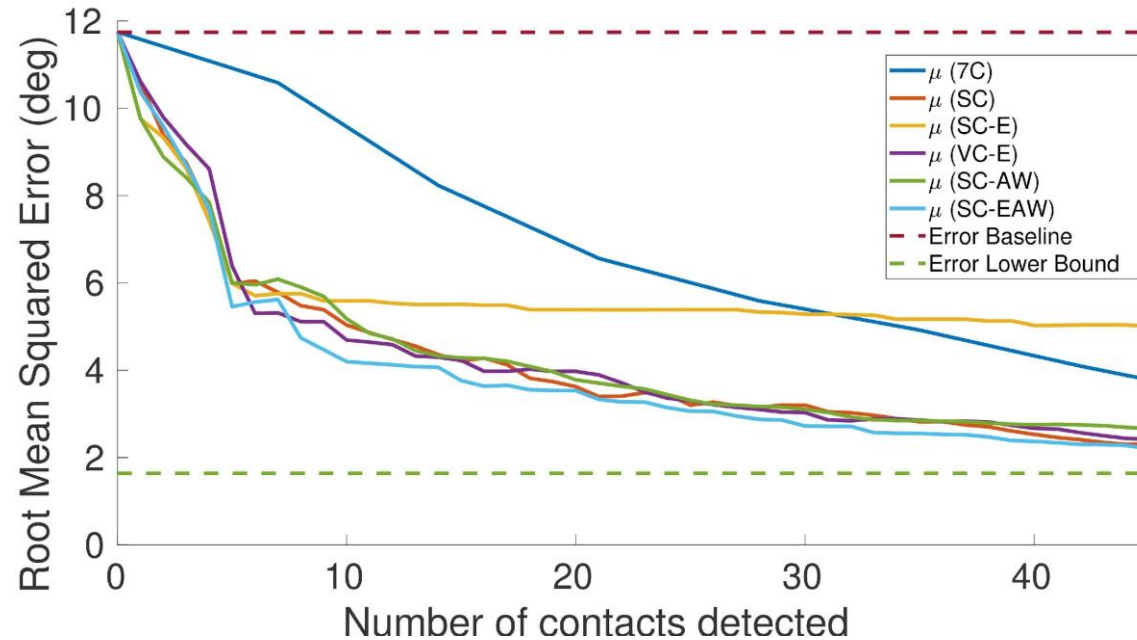

Simplified iCub arm (2 DoF)

■ iCub Simulator:

- 3 reachable surfaces;
- Artificially introduced offsets.

Results

10-Experiments estimation mean over 45 contacts on 3 different surfaces.

- Best results for SC-EAW;
- Up to 80% error reduction;
- Robust to different (and slow-time varying) offsets.
